DETAILED ACTION

Response to Arguments

Applicants' arguments, see pages 6-8 of the Remarks section of the Amendment, filed on January 5, 2005, with respect to claims 1-23, more specifically, independent claims 1, 11 and 16, have been fully considered and are persuasive. The rejection of claims 1-23 has been withdrawn.

Allowable Subject Matter

Claims 1-23 are allowed.

The following is an examiner's statement of reasons for allowance:

As for independent claims 1, 11 and 16, the prior art, alone or in combination, does not teach or fairly suggest a method of transmitting, receiving, processing and storing, "cache program data... and a boot object having location information associated with the cache program data and requiring storage of the cache program data... [and] storing the cache program data based on location information stored in the boot object."

As for the most pertinent prior art of record, the Payton (USPN 5,790,935) reference discloses a method and system for delivering virtual on-demand programming to a television user. Payton discloses that the central distribution server 24 in Fig. 2 (col. 4, lines 55-64) transmits program data through the central transmitter 48 to the local receivers 52 (col. 5, lines 55-67), and recommended programs may be transmitted to and stored at the local server 28 or receiver (col. 6, lines 1-19). However, the Payton reference does not explicitly disclose the claimed limitations of, transmitting, receiving, processing and storing, "cache program data...

and a boot object having location information associated with the cache program data and requiring storage of the cache program data... [and] storing the cache program data based on location information stored in the boot object.”

Another reference, Chaney et al (USPN 5,642,153), discloses the transmission of a set of data known as a Master Program Guide, which relates to television program titles, their start times and end times, a virtual channel number to be displayed to a user, and information allocating virtual channels to transponder frequencies. In addition to, Chaney et al teaches a system that is capable of transmitting hundreds of programs with a number of services, which may include video signals, audio signals, closed caption signals, or other data, including executable computer programs for an appropriate receiver, where each service of each program is identified by a unique Service Component Identifier (SCID), and the information for the respective services is transmitted in packets of predetermined amounts of data and each packet includes a SCID corresponding to the service (see col. 4, lines 9-19). However, the Chaney et al reference does not explicitly disclose the claimed limitations of, transmitting, receiving, processing and storing, “cache program data... and a boot object having location information associated with the cache program data and requiring storage of the cache program data... [and] storing the cache program data based on location information stored in the boot object.”

In the Applicant’s invention the features as described above are specifically disclosed in the limitations of claims 1, 11 and 16.
